A tool to help policy makers see how the timing and intensity of different social distancing interventions can impact COVID-19 in each state.

California:
Currently policies are not containing the epidemic  

NEW COVID-19 CASES EACH DAY

If California continues with current level of reopening

If California implements a 4-week lockdown starting 8/24

The number of new cases in California each day is expected to rise again unless policy changes are made.

- Continuing with the current level of reopening is expected to lead to another increase in the new COVID-19 cases per day in California.
- Implementing a strict lockdown period of 4 weeks can significantly reduce the number of new cases per day. This would be the fastest way to contain the epidemic in California.
